

# Debnel Tarrow

## 1. Basic foundation of knots

### a. How to represent them

i. Projections

ii. Diagrams

### b. What we can do with projections

i. Mirrors (chiral/achiral)

ii. Orientation (reverse, invertibility)

iii. Composition

## 2. Equivalence

### a. $\Delta$ -equivalence

i. Closed polygonal curves

ii. Elementary moves

### b. R-equivalence

i. Smooth curves

ii. R-moves and planar isotopies

## 3. Classification

### a. Families

i. Twist knots

ii. Pretzel links

iii. Torus links

### b. Distinctness of knot families

## Questions:

1. Explain the process of knot composition. Can two knots be composed in more than one way? Why or why not?

2. Show that the following knot is alternating using R-moves:

Label each move

3

## Definitions

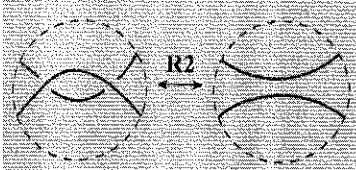

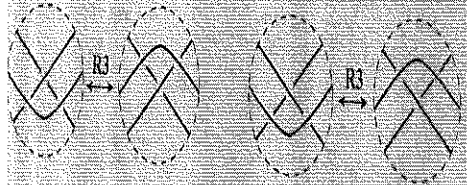

L - Link, D - Diagram of L.

**Definition** (section, page)

### Chapter 1

<b>Crossing Number</b> (2, 12) The minimum number of crossings necessary to make a diagram of L.	<b>Unknotting Number</b> (2, 14) The minimum number of crossing to change on L to make the unknot	<b>Mirror image</b> (5, 17) Denoted $D^m$ , obtained by changing all the crossings of D.
<b>Chiral/Achiral</b> (5, 17) L is chiral if it is not equivalent to its mirror image, and achiral if it is.	<b>Composition/composite</b> (6, 18) The composition of two or more non-trivial knots is made by removing an arc of each knot and attaching the knots via the ends. The result is a composite knot.	<b>Factor knots/Prime knots</b> (6, 19) The knots non-trivial knots forming a composite knot. A knot with exactly one factor is prime.

### Chapter 2

<b>Elementary move</b> (1, 28) Replacing the line segment(s) between adjacent points on L by the line (segment)s of an elementary triangle.	<b>Delta/R equivalence</b> (1, 28) (2,37) Two diagrams are delta equivalent if they differ by a sequence of links obtained from applying planar isotopies. Add R-moves for R equivalence.	<b>Planar isotopy</b> (2, 31) Elementary triangles coinciding with (i) no / (ii) exactly one / (iii) exactly two non-adjacent lines.
	<b>R1 - R3</b> (3,39) 	

### Chapter 3

<b>Twist knot</b> (1,46) Denoted by $T_n$ . Obtained by twisting parallel strands together and hooking the ends together.	<b>Pretzel link</b> (2,47) Denoted by $P_{p,q,r}$ . From the bottom, twist clockwise for negative values and counter-clockwise for positive values	<b>Torus link</b> (3,49) Denoted by $T_{p,q}$ where p is the number of horizontal strands and q is the number of crossings. For $q < 0$ , inner->outer. For $q > 0$ , outer->inner.
--	---	--

Lemma 2.2.6-2.2.7

Theorem 2.3.1

Number of components in a pretzel knot

Proposition 2.2.14

given  $K, 2$   
show  $K \# 2$  is  
unknot  
(impossible)

Number of components in a torus knot

## Things We Have Studied Before Test 1

- What is a link/knot (components)
  - Knot – a circle twisted and “knotted” in space — *a simple closed polygonal curve in  $\mathbb{R}^3$*
  - Link – 1 or more interconnected knots
- Knot diagram  $\rightarrow$  Regular projection (add crossing info)
- Unknotting number and crossing number
- Alternating
- Orientation (arrow)
- Chiral
  - When a knot is inequivalent to its mirror image
- Reverse
  - The other orientation
- Invertible
  - Changing the knot to get the reverse
- Composition
  - Prime
    - A knot is called “prime” when it cannot be realized as the composite of two non-trivial knots (no unknot)
  - Depends on orientation
- Equivalence —  *$\Delta$ -equivalence — R-equivalence*
- Isotopies
- R-1, R-2, R-3 moves
- Families of Links
  - Twist Knots
    - Invertible
    - T1 is trefoil
  - Pretzel Links
    - How many components
      - All odd = 1 component
      - 2 odd = 1 component
      - 1 odd = 2 components
      - All even = 3 components
    - If all 3 have same sign, then the pretzel is alternating
    - Pretzel links can be twist knots
    - Can rearrange the 3 segments into any order
      - Rotate them by 1

- Can flip all upside down and they are still the same (reverses order)
- Torus Links
  - First number is number of strands, second number is number of twists.
  - How many components
    - Greatest common divisor of two numbers
  - Can be a pretzel link
  - Can be a twist knot
    - $T_{2,3}$  is a trefoil

### Potential Exam Questions

1. Give us a Torus link in the form of  $T_{p,q}$  and ask us to a) draw it b) determine how many components it has and why we think that and c) state whether it is a knot.
2. Given a picture of a knot (of your choice based on the time allotted and length of the exam), find the unknotting number.
3. You could always ask for definitions, since you normally do that. I would suggest the definition of a knot, since that is kind of the foundation of this class.

## Outline

- Explored common questions and basic properties of knots
- Explored ways of representing knots
- Defined knots and links
- Defined two concepts of equality of knots and links
- Sketched the outline of a proof that these two concepts of equality are the equal
- Discussed examples of classes of knots
- Informally proved a number of minor results about some of these classes of knots.

### Possible test questions

1. Classify the move in the diagram.

- R1
- R2
- R3
- Isotopie
- Illegal move

2. Find a series of Delta moves that demonstrates that the two diagrams are equivalent. (where the box represents some general knotted structure).

Danijel  
Christoffer

\* Week one: 01/09 - 01/13

- explored playing with knots, found out how to draw a correct diagram of a knot and links without leaving any details out.
- learned various definitions and new concepts and orientation.

\* Week two: 01/13 - 01/20

- learned about achiral & chiral
- through an activity we found out that there aren't many ways to have useful notations for knots.

\* Week three: 01/23 - 01/27

- learned to manipulate link diagrams by elementary triangles and moves.
- learned  $\Delta$ -equivalence and practiced changing links to see if they are the same links by smaller elementary moves,  $R$ -equivalence.
- learned of planar isotopies,  $R_1, R_2$  and  $R_3$  moves
- Defined the definition of a knot - a simple, closed polygonal curve in space.

- We found that by making a point we can make an elementary triangle.

- learned of lemma 2.2.6 and used it to prove lemma 2.2.7

\* Week four: 01/30 - 02/03 and there's only two sub-triangles  
segments in each

- if a multiple point is not involved then we can make an elementary triangle from just planar isotopies,  $R_1$  and  $R_2$  moves.

\* Week five: 02/06 - 02/10

- Introduced to different families of knots, twist, pretzles, and torus links.
- The family of torus links and family of twist knots are not distinct.
- For all pretzle knots,  
 $abc \cong bca \cong cab$

## Questions for knot theory exam.

- Chapter 1

- Projections, Diagrams, and equivalence
  - Differences between diagrams and projections
  - How can we tell when knots are equivalent.
- Crossing and Unknotting numbers
  - Determine crossing numbers of a knot.
  - What is an unknotting number?
- Alternating Knots
  - When is a knot alternating?
  - The Unknot is alternating?
- Games
- mirrors , orientation and inverses
  - What is the mirror image of a knot?
  - When is a knot chiral?
  - Orientated diagram does it matter for a particular knot?
- Knot composition and prime knots
  - When is knot a composite knot
  - When is a knot considered prime
- Knot notation
  - Useful for describing knots to others when pictures are not an option.
- Questions in knot theory
  - How might one determine if any 2 given knots are equivalent.
  - How can we prove that 2 knots are not equivalent
  - How can we tell if a knot is prime
  - How can we determine the unknotting number

- Chapter 2

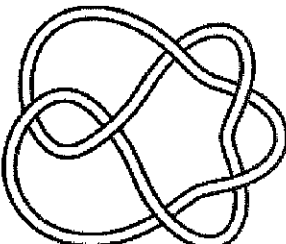

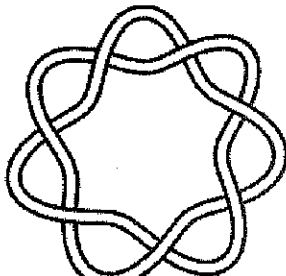

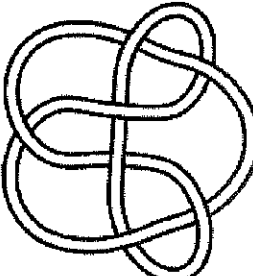

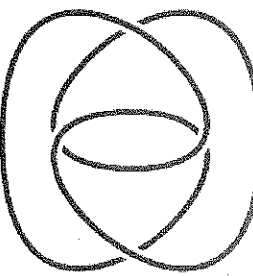

- Polygonal curves and Delta equivalence
  - Knots as closed polygonal curves
  - Delta moves with triangles.
  - Delta equivalent if set of delta moves
  - Elementary moves.
- Diagram equivalence via R-moves
  - Planar isotopies
  - Subdividing a triangle
  - Reidemeister moves
    - 3 types
- The equivalence of delta and r equivalence
  - If a set of knots are delta equivalent then they are r equivalent as well.
  - Transform a knot from one to another
  - ~~Dope~~ knot that is all knots 6 crossing or fewer.

Red

- Nonequivalence and Invariance
- Families of links and braids
  - Twist knots
  - Pretzel links
  - Torus links

3. Determine the following for each knot below

- a. The unknotting number
- b. The crossing number
- c. Is the knot alternating?

Knot	Unknotting number	Crossing number	Alternating
			
			
			
			

4. Using planar isotopies and R moves how that  $P_{5,-1,-1}$  is equivalent to  $6-1$

5. Using elementary moves, demonstrate that figure 1 can be transformed into figure 2.

5. Why is it best to use a link diagram instead of a link projection?

6. Show that the following knot is or is not chiral.

## Questions

1. Show that via a series of R-Moves and planar isotopies that the following knot can be transformed into the unknot.

2. For the link  $T_{4,10}$  do the following

a. Draw  $T_{4,10}$

b. Determine the number of components in the link. Is it a knot?
